

Research Topic for the ParisTech/CSC PhD Program

Subfield: Analytical chemistry, Bioprocesses, Metabolomics, Molecular biology, Microbial ecology

ParisTech School: AgroParisTech

Title: New perspectives for improving the operation of anaerobic digesters: use of omic approaches to understand and prevent disturbances occurring during co-digestion.

Advisor(s): Laurent Mazéas and Olivier Chapleur, laurent.mazeas@irstea.fr and olivier.chapleur@irstea.fr, research scientists at HBAN Research Unit, Irstea, FRANCE

Short description of possible research topics for a PhD:

Anaerobic digestion (AD) is a microbial bioprocess of degradation of the organic matter which ultimately produces biogas rich in methane that can be converted to electrical and thermal energy. It is used to recover different types of organic waste. However AD is very sensitive to different types of perturbations that can lead to process failure.

In this PhD project we want to focus on perturbations of AD that can occur during co-digestion of different substrates by using the omic methodologies. Laboratory experiment simulating digesters disruption will be performed. DNA sequencing will enable to follow the microbial dynamics after the perturbation and metabolomic analyses will describe evolution of metabolic pathways. The analysis of these omics data by biostatistical tools will allow extracting the relevant correlations between the various types of data to identify the causes of the failure and propose strategies of successful management to improve co-digestion. In particular we want to set microbial indicators of optimal performance and warning indicators of process failure.

Required background of the student:

Analytical chemistry or microbial ecology/molecular biology or experience in biotechnology and bioprocesses engineering. Good knowledge of bioinformatics and biostatistics will be considered positively as well as lab work experience.
